CARE-LIFE Framework

Internal Operating Model (Draft)

Linking Lifecycle Support, Casework and Data Structure

OPERATIONAL ALIGNMENT FOR SUPPORT CONTINUITY

Why We Are Structuring This Now

D4GX Compliance

D4GX requires a structured data model to support advanced analytics and reporting.

Succession Planning

Visibility into backup caregivers and future readiness is currently limited.

Data Integration

Current member data is fragmented across multiple touchpoints and systems.

Signal Tracking

Caregiver wellness and engagement signals are not yet systematically tracked.

This framework aligns programme, casework and data structure.

Lifecycle Stages vs Caregiving Burden

STAGE 1

Early Years

Cradle – 7yr

- Diagnosis uncertainty
- Family baseline formation
- Early intervention load
- High emotional volatility

STAGE 2

School Years

7 – 19yr

- Transition stress
- Therapy coordination
- Social integration
- Sibling impact

STAGE 3

Adulthood

19 – 40yr

- Employment uncertainty
- Legal and financial planning
- Chronic health complexity
- Caregiver fatigue accumulation

STAGE 4

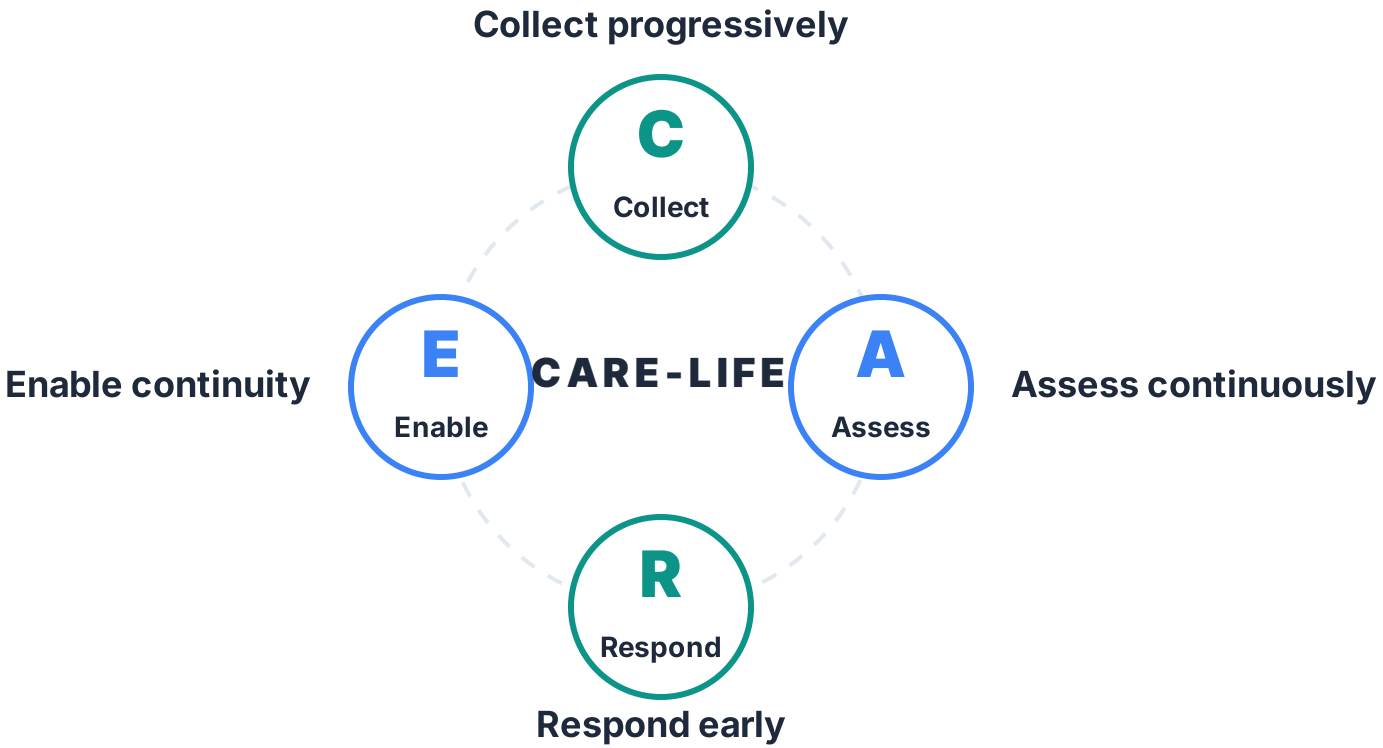
Succession

40 – Grave

- Backup caregiver gaps
- Aging caregiver health decline
- Care transition planning
- Continuity risk

Operational Implication: **Data structure must capture evolving burden and continuity risk across lifecycle.**

The CARE-LIFE Operational Loop



Collect → Assess → Respond → Enable → Repeat across the caregiver lifecycle.

How This Links to the Use Case Diagram

CURRENT WORKFLOW

Existing Use Cases

- Onboard caregiver
- Submit support request
- Assign key worker
- Attend programme

CARE-LIFE LOGIC

New Use Cases

- Provide family information
- Update succession plan
- Wellness check-in

The diagram reflects CARE-LIFE logic: Bridging casework and data structure.

How This Links to the Data Model (ERD)

FOUNDATION FOR LIFECYCLE TRACKING

Stable Person Object

Anchoring on a stable Person object enables **longitudinal visibility**, allowing us to track the caregiver's journey over time without data fragmentation.

FamilyUnit

Adds critical **household context**, grouping individuals to visualize the broader support environment.

PersonRecipientLink

Captures specific **caregiving relationships** over time, ensuring continuity as needs evolve.

Backup Mapping

Identifies secondary caregivers to enable proactive **succession planning** and readiness.

The data model enables structured tracking of the caregiver journey across the lifecycle.

What Signals Will We Systematically Capture?

- **ZBI-6 Baseline**
  Validated caregiver burden scale at intake.
- **Support Interactions**
  Frequency and depth of caseworker touchpoints.
- **Programme Participation**
  Engagement levels in structured support activities.
- **Family & Backup Mapping**
  Completeness and readiness of support network.
- **Event Attendance**
  Periodic pulse signals from community interactions.

These signals form the raw inputs of the CARE-LIFE framework.

The task is to structure them into interpretable dimensions as part of the new data model implementation.

Proposed Caregiver Wellbeing & Sustainability Domains

WORKING DISCUSSION

These domains organize systematic signals into dimensions of caregiver burden and continuity risk.

Emotional Health
ZBI-6 scores, interaction sentiment

Physical Well-being
Health self-reports, respite usage

Social Connection
Event attendance, peer engagement

Knowledge & Skills
Workshop participation, resource usage

Financial Stability
Aid referrals, financial mapping

Future Sustainability
Succession status, legal readiness

Support Network Capacity
Backup caregivers, network depth

INTERNAL FEEDBACK

> **Are these domains sufficient to reflect evolving burden and continuity risk?**

Indicator View: Multi-Dimensional Caregiver Burden

This conceptual view shows how caregiver strain can vary across dimensions and shift over time.

Emotional Health
Stress, coping, psychological strain

Physical Well-being
Caregiving load, health strain, respite access

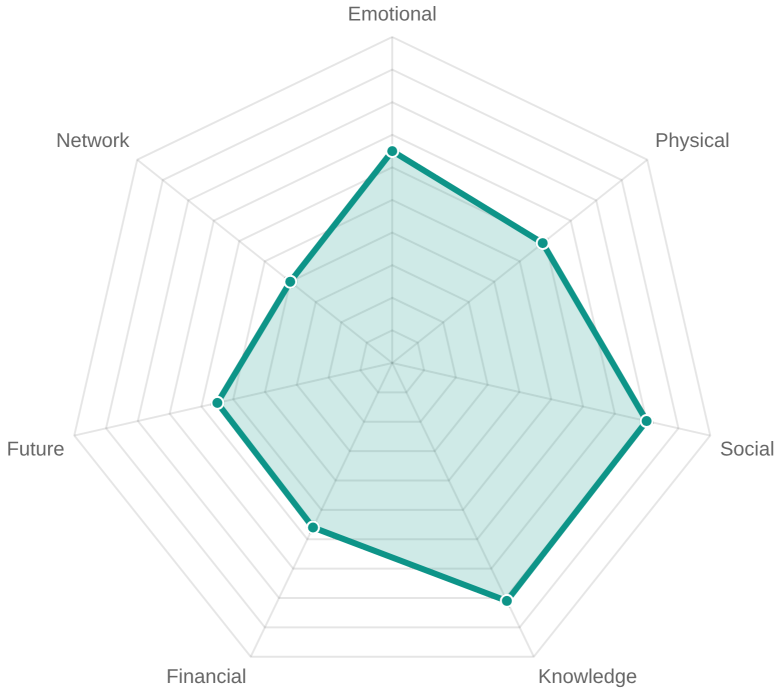
Social Connection
Peer support, community ties, isolation risk

Knowledge & Skills
Caregiving competency, training, resource literacy

Financial Stability
Care costs, financial stress, aid access

Future Sustainability
Succession planning, legal readiness, long-term continuity

Support Network Capacity
Backup caregivers, network depth, shared responsibility



From Domains to Indicators

This stage explains how structured domains translate into interpretable indicators for family and community visibility.

Individual-Level Visibility

Tracking domain shifts across time to identify changes in family needs.

Community-Level Visibility

Aggregated domain signals by geography to reveal regional support gaps.

Indicators guide prioritisation and resource allocation — not automated labelling.

Operational Implication

This stage shows how structured visibility translates into coordinated individual and community action.

Individual Action

- Key worker outreach
- Geo-matched peer support
- Escalated review
- External referral

Community Action

- Geo-targeted CAREConnect sessions
- Succession planning workshops
- Thematic campaigns

When caregiver burden evolves across life stages, our CARE-LIFE operating model captures that evolution and translates it into earlier, structured continuity action.
